

Deterministic evidence producer

(pure Python, offline)

Evidence E

entities A_E · measured values V_E · anchor a^*

*TIER A: $\text{enum}(A_E)$ bound into
tool schema at call time*

untrusted

LLM narrator (any provider)

answers via submit_investigation tool

*x violation:
retry (≤ 2),
names items*

TIER B: deterministic verifier (plain code)

(1) entities $\subseteq A_E$ (2) $|v - V_E| \leq \varepsilon$ (3) a^* addressed

✓ faithful

*after budget:
strip unsound /
flag omission*

User

validated citations + verified claims,
then free text marked NOT verified
